

## ASSIGNMENT – 4

### Ultrasonic sensor simulation in Wokwi

Date	31 October 2022
Team ID	PNT2022TMID07157

#### QUESTIONS:

Write code and connections in wokwi for the ultrasonic sensor. Whenever the distance is less than 100 cms send an "alert" to the IBM cloud and display in the device recent events

#### CODE:

```

### IBM CLOUD OUTPUT:

The screenshot displays the 'Recent Events' tab for a device named 'my-thing'. The page header includes navigation links: 'Browse', 'Action', 'Device Types', 'Interfaces', and an 'Add Device' button. The main content area has tabs for 'Identity', 'Device Information', 'Recent Events' (which is selected), 'State', and 'Logs'. Below the tabs, a text block states: 'The recent events listed show the live stream of data that is coming and going from this device.' A table follows, showing the recent events. The table has four columns: 'Event', 'Value', 'Format', and 'Last Received'. There are four rows of data, all with the event name 'event\_1' and a value indicating distance and alert status. The 'Last Received' column shows 'a few seconds ago' for each entry.

Event	Value	Format	Last Received
event_1	{"distance":7,"Alert":"Distance less than 10"}	json	a few seconds ago
event_1	{"distance":9,"Alert":"Distance less than 10"}	json	a few seconds ago
event_1	{"distance":8,"Alert":"Distance less than 10"}	json	a few seconds ago
